

Ages 6 months and older are now eligible for the COVID-19 vaccine!

The Pfizer and Moderna COVID-19 vaccines are now authorized for individuals ages 6 months and older. Data from the clinical trials and real world studies show the vaccines are highly effective at preventing infections, serious illness, hospitalization, and death from COVID-19.

COVID-19 Vaccines Are Safe

The science used to create the vaccine has been in development for more than a decade. The speed of the vaccine development was due to bureaucratic involvement to make the vaccine accessible to the public.

Side Effects After Getting Vaccinated Are Normal

It is common to have mild or moderate symptoms after getting the COVID vaccine. This means the vaccine is working and your body is starting to create an immune response and learning to fight the virus.

COVID-19 Vaccines Have Not Been Linked To Infertility Or Miscarriage

There is no data showing the COVID-19 vaccines cause infertility or miscarriages. It is not biologically possible that the vaccine can cause bleeding during pregnancy. The vaccine does NOT interact with your DNA or cause genetic changes.

COVID-19 Vaccines Do NOT Give You COVID-19

COVID-19 vaccines don't contain any part of the virus, so you won't get COVID-19 from the vaccine. The vaccine is not a live virus. The vaccine protects you from COVID-19, it does NOT make you spread the virus.
